Team

John (Jonguk) PARK | Founder & CEO

- MS, Bio-AI Convergence — NGS-based mealworm gut microbiome research
- Leads IP strategy: 26 IP assets, 12 granted patents

Jongrok JEON | CTO

- PhD, Agriculture (Bio-engineering)
- Full Professor, Gyeongsang National University; sustainable upcycling

Gabriel (Seongyeon) KWON | CSO

- Former Hitachi & HP — strategic planning
- Multilingual global BD; leads Southeast Asia and EU partnerships

Jihoon PARK | CDO

- MS, Seoul National University (GSES); former urban planner
- Leads tech commercialization and the carbon track

Seunggi PARK | CRO

- PhD, Agriculture (Civil & Environmental Engineering)
- Full Professor, Kongju National University

Sean TAN | Business Development – ASEAN

- Co-founder, KILSA Global; former Citibank & Standard Chartered
- Specializes in business expansion across ASEAN

Yi NAM | Principal Technical Advisor

- PhD, Agriculture (Soil Science)
- Former General Manager, Fertilizer Dept., Nonghyup (NACF)

Gut Microbe Cultivation

Plastics Conversion to Humic-like Substance

Humic-like Fertilizer Production

R&D Network

- 9 joint R&D teams: 5 Korean universities incl. KAIST, 2 national institutes (KRIBB, KIT)
- Singapore: MOU with Temasek Polytechnic; NDA with A*STAR
- Malaysia: carbon capture initiative with Musang Valley Plantation
- Daejeon Synthetic Biology Global Innovation Zone participant

Problem

- EPS (styrofoam) is bulky and hard to recycle; most is incinerated or landfilled.
- Humic fertilizers depend on mined leonardite — a finite, coal-derived feedstock with uneven quality.
- Tropical plantations and urban landscapes need organic soil inputs that hold up under heat and rain.

Solution

- Lv1 (commercial):** mealworms feed on an EPS "FeedBlock"; humic acid is extracted from their frass as MaHa.
- Lv2 (pilot, TRL 5):** an isolated gut-microbe consortium and its enzymes convert plastic into humic-like substances — no live mealworms.

Key Features

- Third-party trials: pak choi root length +77.1% (rank #1 of 8); durian seedling height +66.6%.
- Chrysanthemum trial: +40% blooms and about 10 more flowering days.
- OMRI Listed (mcw-21964) · ISO 9001/14001/45001 · EPD; liquid concentrate that blends with other inputs.

Business Model

- Fertilizer:** MaHa sales to plantations, landscapers and distributors (B2B/B2G).
- Plant + enzyme kits:** modular Lv2 conversion plants with recurring enzyme-kit supply.
- Carbon services:** certification sponsorship and credit brokerage fee; credits remain with the land operator.

ASEAN Market Strategy

① Regulatory bridge through joint R&D

- Joint R&D with Temasek Polytechnic (MOU, Sep 2026) to validate that Lv2 output is equivalent in function and safety to the OMRI Listed Lv1 product.
- SAC-SINGLAS accredited analysis on real EPS/PS waste from Singapore's recycling network — the dossier that opens Lv2's regulatory pathway.

② Regional sales hub for fertilizer and equipment

- Fertilizer:** within a few hours of Malaysia, Thailand, Indonesia and the Philippines, MaHa reaches plantation and landscape buyers via local distributors.
- Equipment:** Lv2 modular plants and recurring enzyme kits across Southeast Asia — USD 1.0M equipment MOA in Thailand; KILSA Global JV forming as regional operator.

Business Snapshot

- Funding:** US\$0.8M equity (Pre-Series A) + US\$2.3M non-dilutive Korean government R&D; raising Series A up to US\$2.0M.
- Traction:** FY2025 revenue US\$0.71M; 7 export deals, 53.1 t shipped to 6 countries incl. Singapore.
- IP:** 26 assets — 12 granted patents, 2 PCT filings, 2 deposited strains (KCTC).
- Recognition:** CES 2025 Innovation Award · VivaTech 2026 Tech for CHANGE Top 30 · Net Zero Challenge X.

Seeking Opportunities

- Series A investors** — climate, agri-food and circular-economy VCs and CVCs in Southeast Asia
- Distributors and bulk buyers for MaHa** — plantation, landscape and nursery channels across Southeast Asia
- Buyers and operating partners for Lv2 modular plants** — waste handlers, recyclers and industrial parks in the region
