## Team

### Kibaek Gweon | Founder & CEO

- Former Advertising Strategist
- Won 30+ business awards
- Selection of Korea's Pre-Green Unicorn

### James Lee | CTO

- Ph.D. Candidate in Chemistry, Korea University
- Serial entrepreneur; previously founded a chemical materials startup
- Cr-TPA  
(Chemically Recycled Terephthalic Acid)

- Cr-EG  
(Chemically Recycled Ethylene Glycol)

## Seeking Opportunities

- Series B investors
- Local partners for plant construction in Asia
- Offtake partners and new customers (brand owners, fiber and packaging makers)

## Problem

- PET is one of the most produced and discarded plastics, and ~75% of its carbon footprint comes from making its monomers (TPA, EG) from crude oil.
- Mechanical recycling degrades quality and color with every cycle and cannot process colored, composite, or contaminated waste.
- Most chemical recycling requires high temperature and pressure, making it too costly and energy-intensive to scale.

## Solution

- Our low-temperature, ambient-pressure process depolymerizes PET waste into high-purity monomers, cutting both cost and carbon emissions.
- Handles colored, composite, and contaminated PET and polyester textiles that mechanical recycling rejects.
- All PET is made from TPA and EG, so our Cr-TPA and Cr-EG are drop-in replacements for virgin feedstock, with no changes to existing plants.

## Key Features

- Virgin-grade purity (99%+): Cr-TPA and Cr-EG as virgin specifications for textiles, films, and packaging.
- Other revenue stream: Our process by-product, potassium sulfate ( $K_2SO_4$ ), is sold as a premium fertilizer.
- Commercial scale: Operating a 4,000 t/yr depolymerization plant, the world's largest low-temperature PET depolymerization facility.

## Business Model

- Closed loop: We recycle a client's own waste back into their products, reducing virgin material purchases and incineration.
- Gate fees & carbon credits: Fees for processing colored and composite waste, plus carbon credit revenue.
- Product sales: B2B sales of Cr-TPA, Cr-EG, and premium  $K_2SO_4$  fertilizer.

## Business Snapshot

- Series A: Raised KRW 15.9B (~\$12M)
- Recognition: Selected as a Korea "Pre-Green Unicorn"
- Partnerships: 40+ open innovation partnerships with industry leaders
- Validated applications: Completed PoCs in automotive, electronics, textiles, engineering plastics, and biodegradables
